

## Adult Feeding Guide

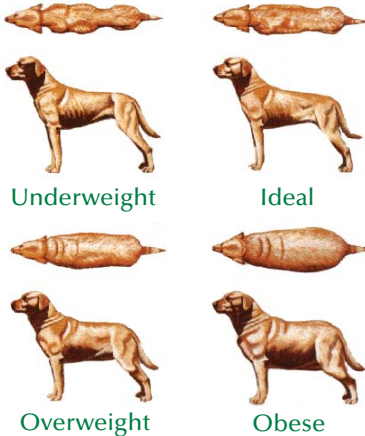

The table on the right provides a basic guide to the number of grams of Naturediet adult menus to feed to an adult dog.

The guide assumes no other food is fed and is based on average calories required for normal maintenance of an adult dog with average exercise.

Each dog is an individual and feed requirements will vary depending on living conditions and the amount of exercise undertaken.

Weigh the dog at regular intervals and adjust the amount fed to maintain the ideal weight.

The pictures below will help assess the dog's body condition.

Underweight

Ideal

Overweight

Obese

For dogs requiring less calories, use Senior/Lite at the recommended feeding levels and adjust amounts according to body condition.

Bitches during late pregnancy will require food intake to be increased by approximately 10% each week from the sixth week of pregnancy.

Lactating bitches need to be fed increasing amounts to maintain their original body weight; this will depend on the size of the litter being fed.

We care what goes into our food, because you care what goes into your pet

## Puppy Feeding Guide

The table on the right provides a basic guide to the number of grams of Naturediet Puppy/Junior menu to feed from weaning to approximately six to eight months of age.

It should be born in mind that in the first six months of life puppies grow at an astonishing rate, a growth that we humans take up to 14 years to achieve.

This high growth rate requires a high calorie intake to enable the animal's full growth potential to be achieved.

At peak growth rate this feed intake can equate to as much as twice the requirement of adult consumption. This should be split across at least 3 meals per day as their stomachs are small and only able to cope with small frequent meals.

Consider this as an investment. The higher the quality of nutrition at this stage, the better chance the puppy has of developing to its full potential.

As with all feeding, monitor the puppy's weight gain and body condition and adjust the amount accordingly.

Bodyweight in Kg	Grams food per day
1	180
